# 1 SAP Cloud for Customer OData API

The SAP Cloud for Customer OData API conforms to OData version 2 specification.

The complete list of collections (or data end-points) of SAP Cloud for Customer OData API, are listed in the OData API Reference section of this document.

## Related Information

[OData Version 2.0 Specification](#) ➡

[SAP Cloud for Customer OData API 2.0 Reference](#)

## 1.1 Purpose

Use the OData API, to query, read, add, update and delete data from and into SAP Cloud for Customer.

This document is a reference point for learning SAP Cloud for Customer OData API. You'll find a short introduction to the capabilities of the OData API as well as information on where to find more details.

## 1.2 What is OData?

OData (Open Data Protocol) is an OASIS Standard that defines a protocol for building and consuming RESTful APIs, based on the HTTP protocol.

OData differentiates itself from most of the other RESTful APIs, mainly by providing the following:

- Metadata of the entities exposed by the OData service
- Relationship between the entities within an OData service
- System and custom query options for retrieving data

The protocol allows filtering data, ordering and paginating of the query results, retrieving number of records, and more. Querying and modifying data is possible in XML (AtomPub) and JSON formats.

For more information on OData protocol, please visit to <http://www.odata.org>, where you can find different versions of OData specifications, community resources (such as OData providers and consumer libraries), sample OData services and tutorials.

<http://www.odata.org/> ➡

## 1.3 Accessing OData API

You can access the SAP Cloud for Customer OData API of your tenant, with the URL pattern: `https://<your_tenant>/sap/c4c/odata/v1/c4codataapi`

## 1.4 Accessing Metadata of the OData API

You can access the metadata of the OData API of your tenant, with the URL pattern: `https://<YourTenant>/sap/c4c/odata/v1/c4codataapi/$metadata`

## 1.5 Authentication

Learn about security options for accessing the SAP Cloud for Customer OData API.

Client applications using the OData API, have four options for providing authorization and authentication for their users:

- Basic Authentication
- OAuth 2.0
- X.509
- SAML (Security Assertion Markup Language) based single sign-on.

Using OAuth 2.0 requires a trust relationship to be configured between SAP Cloud for Customer and the identity provider of your client application in the Administrator work center.

See [Create Trust Between the Customer Account and SAP Cloud for Customer](#).

## 1.6 Authorization

Authorization of a business user in the user interface is usually the same as the authorization in OData Services. However, there are some exceptions to this behavior.

### Exceptions to Authorization Behavior

See the following table to learn about the exceptions.

Use Case	Description	Behavior in User Interface (UI)	Behavior in OData Service
<b>Restriction at Work Center View</b>	Work center view is assigned with no restrictions in the Administrator work center.	Work center view is visible without data restriction.	OData service with work center view assigned has full access to all data and operations.
<b>Access Restriction at Instance</b>	Work center view is assigned with Read and Write restriction.  <b>Example:</b> Opportunity with sales territory 17 is restricted (both Read and Write) for the user.	Work center view is visible, and data visibility is restricted as configured in user access management.  <b>Example:</b> User can see opportunities with sales territory 17 only.	OData honors RBAM restriction and limits the access.  <b>Example:</b> Only opportunities with sales territory 17 are available. Create/Update/Delete is restricted for opportunities with sales territory 17.
<b>Restrictions in Field</b>	You can use business roles to restrict (Hide/ReadOnly/Un-Restricted) the fields (standard and extension) from the work center views added to business role.  <b>Example:</b> ExpectedRevenueAmount field in an opportunity is hidden.	The object work list (OWL) doesn't hide the restricted (hidden) field, but data isn't displayed.  The detail view of the UI hides the restricted field.	OData doesn't honor field restriction and field is visible in response.
<b>Action Restriction</b>	You can use business roles to restrict business object actions.  <b>Example:</b> The action <a href="#">Won</a> in Opportunity is restricted for the business role.	UI restricts user from executing the action.	Restriction isn't honored. It's possible to execute the restricted function import.
<b>SAP Key User Tool (KUT) Adaptations</b>	KUT fields with business logic.  <b>Example:</b> KUT field's visibility based on business role.	UI honors KUT adaptations	KUT adaptations aren't honored.

Use Case	Description	Behavior in User Interface (UI)	Behavior in OData Service
<b>UI Switches</b>	<p>UI switches are defined by custom development and can be used to make fields, buttons, or sections of user interfaces hidden, read-only, or mandatory. You can use them to assign a particular version of a UI to a business role and to its affected users.</p> <p><b>Example:</b> A UI section group is read-only. And another one is hidden.</p>	UI switches are honored as configured.	<p>UI Switches aren't honored.</p> <p>Data encapsulated within section groups that is hidden via UI switch is available in OData response.</p>

To learn more about UI switches, see the blog [Make a UI flexible/dynamic using UI Switch](#) .

## Enhancements to Authorization Assignment

Authorization assignments for several OData services are enhanced. With this enhancement, users require the necessary authorizations to consume these OData services.

In previous releases, your users may have been able to consume the impacted OData services without the necessary authorization assignments. For those users, this is an incompatible change. As of the August 2020 release, you must assign the work center view assignments as listed in the table for these users.

Here is a list of impacted services:

OData Service Name	Entity Type Name	Entity Type UI Text (Label)	Authorization Assignment (Assign at least one.)	Data Workbench Relevant Service

### ⚠ Caution

As an administrator, you can assign any workcenter to a OData service without validating the assignment. This will result in business partners with the same workcenter assigned having access to the OData service and being able to retrieve data that are not visible to them in the UI. Hence, you must be cautious while assigning workcenters.

## 1.7 Supported System Query Options

SAP Cloud for Customer OData API supports OData V2 system query options listed below:

- \$count
- \$expand
- \$filter
- \$format
- \$inlinecount
- \$orderby
- \$search
- \$select
- \$skip
- \$skiptoken
- \$top

Usage information, examples and possible restrictions are described in the [SAP Cloud for Customer OData Developer's Guide](#) .

## 2 New Features

### 2.1 What's New in OData API v2 Reference

#### 2.1.1 Business Partner OData Services

This topic lists all OData API documentation that have been modified in each release version.

##### August 2021 Edition

OData API documentation enhanced in the following KT (knowledge transfer documents):

- ODATA\_BUPA\_RELATIONSHIP\_1
- ODATA\_COMPETITOR\_01
- ODATA\_CONTACT\_01
- ODATA\_CUSTOMER\_01
- ODATA\_EMPLOYEEANDUSER\_01
- ODATA\_IND\_CUSTOMER\_01
- ODATA\_PARTNERCONTACT\_01
- ODATA\_PARTNER\_01
- ODATA\_SERVICEAGENT\_01

##### May 2021 Edition

OData API documentation enhanced in the following KT (knowledge transfer documents):

- ODATA\_CONTACT\_01
- ODATA\_CUSTOMER\_01
- ODATA\_IND\_CUSTOMER\_01

##### February 2021 Edition

OData API documentation enhanced in the following KT (knowledge transfer documents):

- ODATA\_ACCOUNT\_DC\_01
- ODATA\_CONTACT\_04
- ODATA\_CUSTOMER\_02
- ODATA\_CUSTOMER\_07
- ODATA\_IND\_CUSTOMER\_02
- ODATA\_IND\_CUSTOMER\_06

## November 2020 Edition

OData API documentation enhanced in the following KT (knowledge transfer documents):

- ODATA\_BUPA\_RELATIONSHIP\_1
- ODATA\_BUPA\_RELATIONSHIP\_2
- ODATA\_BUSINESSPARTNER\_01
- ODATA\_BUSINESSUSER\_01
- ODATA\_COMPETITOR\_01
- ODATA\_CONTACT\_01
- ODATA\_CONTACT\_02
- ODATA\_CONTACT\_06
- ODATA\_CUSTOMER\_01
- ODATA\_CUSTOMER\_02
- ODATA\_CUSTOMER\_05
- ODATA\_CUSTOMER\_14
- ODATA\_EMPLOYEEANDUSER\_01
- ODATA\_IND\_CUSTOMER\_01
- ODATA\_IND\_CUSTOMER\_02
- ODATA\_IND\_CUSTOMER\_05
- ODATA\_MARKETINGATTRIBUTE\_10
- ODATA\_PARTNERCONTACT\_01
- ODATA\_PARTNER\_01
- ODATA\_PARTNER\_02
- ODATA\_SERVICEAGENT\_01

## May 2020 Edition

OData API documentation enhanced in the following KT (knowledge transfer documents):

- ODATA\_ACCOUNTHIERARCHYLIST\_01
- ODATA\_BUYINGCENTER\_1
- ODATA\_BUYINGCENTER\_2
- ODATA\_CONTACT\_01

- ODATA\_CUSTOMER\_04
- ODATA\_EMPLOYEEANDUSER\_01
- ODATA\_EMPLOYEE\_BASIC\_DATA\_01
- ODATA\_IND\_CUSTOMER\_04
- ODATA\_MARKETINGATTRIBUTE\_1
- ODATA\_MARKETINGATTRIBUTE\_10
- ODATA\_MARKETINGATTRIBUTE\_2
- ODATA\_MARKETINGATTRIBUTE\_3
- ODATA\_MARKETINGATTRIBUTE\_4
- ODATA\_MARKETINGATTRIBUTE\_5
- ODATA\_MARKETINGATTRIBUTE\_6
- ODATA\_MARKETINGATTRIBUTE\_7
- ODATA\_MARKETINGATTRIBUTE\_8
- ODATA\_MARKETINGATTRIBUTE\_9

## February 2020 Edition

OData API documentation enhanced in the following KT (knowledge transfer) documents:

- ODATA\_EMPLOYEEANDUSER\_01
- ODATA\_EMPLOYEEANDUSER\_02
- ODATA\_EMPLOYEEANDUSER\_03
- ODATA\_EMPLOYEEANDUSER\_04
- ODATA\_EMPLOYEEANDUSER\_05
- ODATA\_IDENTITY\_01
- ODATA\_IND\_CUSTOMER\_DC\_01
- ODATA\_ACCOUNT\_DC\_01
- ODATA\_CUSTOMER\_01
- ODATA\_CUSTOMER\_02
- ODATA\_CUSTOMER\_04
- ODATA\_CUSTOMER\_06
- ODATA\_BUPAMERGE\_01
- ODATA\_IND\_CUSTOMER\_01
- ODATA\_IND\_CUSTOMER\_02
- ODATA\_IND\_CUSTOMER\_04
- ODATA\_CONTACT\_01
- ODATA\_BUSINESSUSER\_01
- ODATA\_BUPA\_RELATIONSHIP\_1
- ODATA\_MARKETINGATTRIBUTE\_1
- ODATA\_MARKETINGATTRIBUTE\_2
- ODATA\_MARKETINGATTRIBUTE\_3
- ODATA\_MARKETINGATTRIBUTE\_4

- ODATA\_MARKETINGATTRIBUTE\_5
- ODATA\_MARKETINGATTRIBUTE\_6
- ODATA\_MARKETINGATTRIBUTE\_7
- ODATA\_MARKETINGATTRIBUTE\_8
- ODATA\_MARKETINGATTRIBUTE\_9
- ODATA\_MARKETINGATTRIBUTE\_10

## 2.2 Add Public Solution Model (PSM) Fields to Standard OData Services

As an administrator, you can add PSM fields to standard OData services.

1. Click your profile on the top right corner of your screen, and select [Start Adaptation](#).
2. Navigate to the screen where the PSM field exists and click  to select the relevant section. The system highlights the section with a red box.
3. In the side pane, click  next to [Header](#) to see the list of available fields.
4. Navigate to the PSM field and click  next to it. The system highlights the PSM field with a red box to indicate that it is editable.
5. Click [Edit](#). The system displays the table with the list of available OData extensions.
6. Click the **Edit** icon  and the [Action](#) column appears in the table.
7. Under [Action](#), click the **Add Field** icon  next to the OData Service where you want to add the PSM field. The system indicates that it has been added with a check sign in the [Field Added](#) column.
8. Click [Save](#).

### Note

- This is applicable only for standard PSM fields extended via adaptation. PSM fields created using SAP Cloud Applications Studio are not supported.
- You can transport PSM OData configuration from a test to a productive environment via [Transport Management](#). In [Transport Management](#), the [Adaptation Changes](#) provider proposes relevant PSM OData configuration as optional dependencies.
- You cannot remove a PSM field from an OData service if it is already shipped as part of standard OData service by SAP.
- This feature is not available for the Lead UIs, such as Lead, Lean Lead, and Deal Registration UIs.

## 2.3 Transport Custom OData Services with Transport Management

You can use Transport Management to move custom OData Services between different tenants.

Follow this procedure to add a custom OData Service in a Transport Request:

1. To add a Transport Object, under *Transport Object Type*, select *Custom OData Service*.
2. Select the *Custom Service Name* and then click *OK*.
3. Select the transport object and click *Add Selected*.

**Related Information:** See [Configure a Transport Request](#).

## 2.4 Compatibility Mode for READ Operations

We've introduced a new HTTP request header `odata-v2-strict-json-format : true`, which changes the `results` tag in response as follows:

- READ operations with key have `results` tag.
- Expand operations with NavigationProperty with 'many' cardinality have the `results` tag.

When you use this header, you receive a response payload that is compatible with OData API v2 protocol.

This feature is helpful if you use third-party tools that require strict adherence to the OData V2 protocol.

## 2.5 Support for User-Friendly IDs in Standard OData Services

User-friendly IDs (**UIDs** or Known IDs) are available as a key to read, update, and delete data records via standard OData services.

UIDs are the same as the IDs displayed in the user interface and therefore, are more user-friendly. This feature is offered as an alternative to **ObjectID** as the key.

**ObjectID** is used as the key if a UID isn't configured for an entity type. To find the entity type that support UIDs, see the OData metadata.

`https://myxxxxxx.crm.ondemand.com/sap/c4c/odata/uid/v1/c4codataapi/$metadata.`

## 2.6 Constant Values to Function Imports

Assign constant values to function imports of type `Query`.

This feature allows constant values to be passed to a query that simplifies the associated Query request by reducing the number of parameters required.

For example, in a custom OData service, `Activity (BO): Query: QueryByElements.`

If only appointments have to be retrieved using this query (and not other activity types such as email and fax), query parameters `TypeCode`, `GroupCode` can be assigned with the following constant values: `TypeCode EQ "12"` and `GroupCode NE "0027"`.

## 2.7 Integration with SAP Business Application Studio

You can integrate SAP Cloud for Customer with SAP Business Application Studio.

Integration with SAP Business Application Studio enables you to view live SAP Sales and Service Cloud OData services and create SAP business applications such as SAP Fiori, HTML5, or SAP BTP full-stack extensions.

You can use SAP System Provider to integrate SAP Cloud for Customer with SAP Business Application Studio. For more information, see [SAP Cloud for Customer Integration with SAP Business Application Studio](#) and [SAP Business Application Studio](#).

## 2.8 OData Service for Change Documents

You can retrieve change document data for all instances of a given business object using filters.

Currently, change document data is only displayed in the detail view of a business object. By providing an OData service, it would be possible to retrieve change document data for several business object instances based on the filter values.

### Filter Attributes

- Business Object Type - Mandatory
- Business Object IDs - Optional
- Change Date/Time - Optional

### Result List

- ID
- Business Object Name
- Object UUID
- ChangeDateTime
- ChangedByIdentityUUID
- ChangedByUserName
- ObjectNodeElementName
- ObjectNodeElementOldContent
- ObjectNodeElementNewContent

### Supported Business Objects

Business Object	UI Text
Material	Material
ServiceRequest	Ticket
IndividualProduct	Registered Product
Warranty	Warranty

Business Object	UI Text
DealRegistration	Deal Registration
DesignRegistration	Design Registration
Vehicle	Vehicle
BuyingCenter	Buying Center
Contract	Contract
CustomerQuote	Sales Quote
Opportunity	Opportunity
Lead	Lead
Activity	Activity

### ⚠ Restriction

- This service supports only business objects listed above. All other business objects (for example: master data objects like account, contact person, and many more) are not supported.

### Example to use the OData service

Use the following endpoint to fetch the requested changes from your tenant: `https://<tenantURL>/sap/c4c/odata/v1/changedoclist/ChangeDocumentCollection`

The service supports the following filter parameters:

- BusinessObject - Mandatory

### 📌 Note

To query *Ticket* changes use BusinessObject example 'ServiceRequest'.

- ChangeDateTime - Optional
- ObjectUUID - Optional

There is no filter available on Changed Attribute or Modification Type.

In addition standard OData filter like *Top* and *Skip* are supported.

To avoid issues with too high data load the service supports an automatic paging mechanism. In case there are more than 1000 entries fetched the result will be cut on 1000 entries but will provide a next link to fetch the next 1000 records.

Thus, a sample http request may look like: `https://<tenantId>/sap/c4c/odata/v1/changedoclist/ChangeDocumentCollection?$filter=BusinessObject eq 'CustomerQuote' and ChangeDateTime ge datetime'2022-10-07T00:00:00'`

This will fetch all changes done on sales quotes after 2022/10/07.

Authorization method basic (username/password) is supported.

Before returning the result list, the OData implementation checks that the used user has read access for all business object instances for which changes were found. If this is not the case, the system will return an error message.

## 3 OData API Reference

### 3.1 OData API v2 Reference

OData API v2 covers over 40 main business objects, allowing read and/or write access to more than 1000 collections (data points). You can access the API reference document here: [OData API v2 Reference](#).

You can access the metadata of the OData API of your tenant, with the URL pattern: `https://<YourTenant>/sap/c4c/odata/v1/c4codataapi/$metadata`

#### Add Extension Fields to c4codataapi

The service **c4codataapi** is a container for several individual object-specific OData services. Hence, extension fields must be added to these individual services. Extension fields added to individual services automatically reflect in c4codataapi. The individual services that you need to select when adding an extension field to a particular object is listed here.

#### Note

The c4codataapi service does not appear in Key User Extension UI and SAP Cloud Applications Studio.

Object/Entity Type	Service
Appointment	activity
E-Mail	activity
Phone Call	activity
Task	activity
Visit	activity
Business Partner Relationship	businesspartnerrelationship
Buying Center	buyingcenter
Campaign	campaign
Chat Activity	chatactivity
Competitor	competitor
Competitor Product	competitorproduct

Object/Entity Type	Service
Contact	contact
Contract	contract
Account	customer
Individual Customer	customer
Employee	employeeanduser
Installation Point ( Product / Text / Functional Location )	installationpoint
Installed Base	installedbase
Job Definition	jobdefinition
Lead	lead
Marketing Permission	marketingpermission
Measurement Point	measurementpoint
Measurment Document	measurementreading
Opportunity	opportunity
Organisational Unit	organisationalunit
Partner	partner
Partner Contact	partnercontact
Deal Questionnaire	pcmmigration
Deal Registration	pcmmigration
Product	product
Product List	productbusinesspartnerrelation
Registered Product	registeredproduct
Sales Point Of Delivery	salespointofdelivery
Sales Quote	salesquote
Sales Territory	salesterritory
Service Agent	serviceagent
Activity Extension	serviceassignment

Object/Entity Type	Service
Social Media Activity	socialmediaactivity
Social Media User Profile	socialmediauserprofile
Stock Location	stocklocation
Questionnaire	survey
Target Group Root	targetgroup
Service Request	ticket
Time Entry	timeentry
Time Report	timereport

## 3.2 OData API v1 Reference (Deprecated)

SAP Cloud for Customer OData API v1 is deprecated.

### Information on Deprecation

See information on deprecation and our updated [API Strategy \[page 202\]](#).

### OData API v1 Reference (Deprecated)

This section shows the OData entity structure is shown as diagrams.

The entity diagrams are grouped under following sections:

- [Account EntityType \[page 24\]](#)
- [Contact Entity Type \[page 52\]](#)
- [Sales Lead Entity Type \(Deprecated\) \[page 110\]](#)
- [Opportunity Entity Type \[page 120\]](#)
- [Employee Entity Type \[page 71\]](#)
- [Product Entity Type \[page 145\]](#)
- [Service Request Entity Type \[page 153\]](#)
- [Visit Entity Type \[page 185\]](#)

**Group Name Activities:**

- [Appointment Entity Type \[page 42\]](#)
- [EMail Entity Type \[page 63\]](#)
- [Phone Call Entity Type \[page 139\]](#)
- [Task Entity Type \[page 172\]](#)

#### ⓘ Note

For details on the associations between entities, see the navigation details of the respective entity.

The accuracy of the information provided about the Nullable property in the SAP Cloud for Customer OData API collection document might not always be accurate. If the *Nullable* attribute has the value:

- *True*, then this property can be left empty. In some cases, due to application-specific behavior, or the dependency on the value of another property, a property value must be specified even if the value of the Nullable property is indicated as True. For create or update calls on such properties, the system returns a specific error message if the value is left blank.
- *False*, such a property must never be left blank.

## 3.2.1 Account Contact Relationship

### Overview

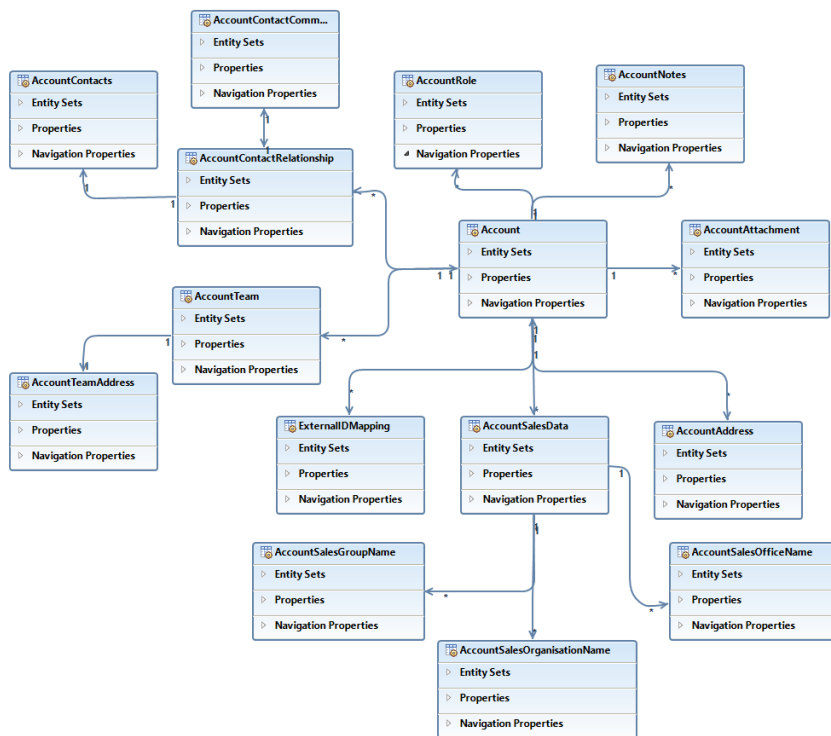

**AccountContactRelationship** entity type is already part of **C4CODATA**, as a part of clean up duplicate entries from other entity type of **AccountContactRelationship** which is **AccountContactCommunicationData**.

### Properties

Name	Type	Description	\$search relevant
EMail	Edm.String	E-Mail	
Fax	Edm.String	Fax	
JobTitle	Edm.String	Job Title	
Mobile	Edm.String	Mobile	
Phone	Edm.String	Phone	

## 3.2.2 Account EntityType

The Account related collections allow you to read and maintain Accounts and their related data such as Address, Contacts related to the Accounts and their addresses.

### 3.2.2.1 Account

#### Overview

The Account collection provides information about corporate customers and prospects. These are existing organizations and potential customers for the company.

## URL

https://<CloudTenant>/sap/c4c/odata/v1/c4codata/AccountCollection

## Properties

Name	Type	Nullable	Max Length	Fixed length	\$ Search Relevant
ABCClassification-Code	Edm.String	true	1	true	
ABCClassification-CodeText	Edm.String	true			
AccountFormatted-Name	Edm.String	false	40	true	true
AccountID	Edm.String	true	10	true	true
AccountName	Edm.String	true	240	true	true
AccountName2	Edm.String	true	240	true

## 3.2.4 BusinessPartner Entity Type

### Overview

BusinessPartnerCollection provides information about all Business Partners i.e. Accounts, Individual Customers, Contacts, Employees, Competitors, Partners etc.

ThingType property refers to the thing type associated with a business partner instance. ThingType is used for navigation and displaying data for corresponding Business Partner in the standard UI in SAP Cloud for Customer. The BusinessPartnerCollection is read-only and can be used to determine the correct entity type referred to in a party collection based on the Party UUID.

### Properties

Name	Type	Description	\$search relevant
UUID	Edm.Guid	Alternative Key of BusinessPartner	Yes
ThingType	Edm.String	Thing Type used in the UI for the particular Business Partner	No

### Mapping

ThingType	Related C4C-BuPa-UI	Corresponding C4CODATA-EntityType
COD_ACCOUNT_TT	Account	Account
COD_CONTACT_TT	Contact	Contact
COD_SEOD_ACCOUNT_TT	IndividualCustomer	IndividualCustomer
COD_EMPLOYEES	Employee	Employee

ThingType	Related C4C-BuPa-UI	Corresponding C4CODATA-EntityType
COD_COMPETITOR_TT	Competitor	Not applicable
COD_PARTNER_TT	Partner	Not applicable
COD_PARTNERCONTACT_TT	PartnerContact	Not applicable

## 3.2.5 CodeList Entity Type

The CodeList Entity Type is a Single EntityType. The EntityGroup description are not required.

### 3.2.5.1 Codelist

#### Overview

The Codelist collection provides a list of codes and their corresponding descriptions for a code type collection. It is automatically added into the service metadata if it contains any properties representing a code type.

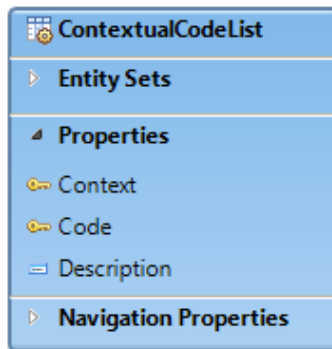

It cannot be created, updated or deleted. This is read-only entity.

#### Properties

Name	Type	Nullable	Max Length	Fixed length	\$ Search Relevant
Code	Edm.String	false		false	
Description	Edm.String	false		false	

## 3.2.6 Contextual CodeList Entity Type

The ContextualCodeList Entity Type is a Single Entity Type. The EntityGroup description is not required.

### 3.2.6.1 Contextual CodeList

#### Overview

Contextual CodeList collection provides a list of contexts, codes, and their corresponding descriptions. ContextualCodeList entity type is automatically added into the service metadata, if the service contains any properties of the type.

Along with Code and Description, ContextualCodeList entity type has a context parameter for which the codes are relevant. For example, Region in an address is contextual. A Region or State "NY" is relevant both for countries with country codes: US and GB. If a user has to fetch all region codes of country "US", corresponding collection has to be filtered using Context = "US". If a context is not provided, all the regions in the world shall be returned.

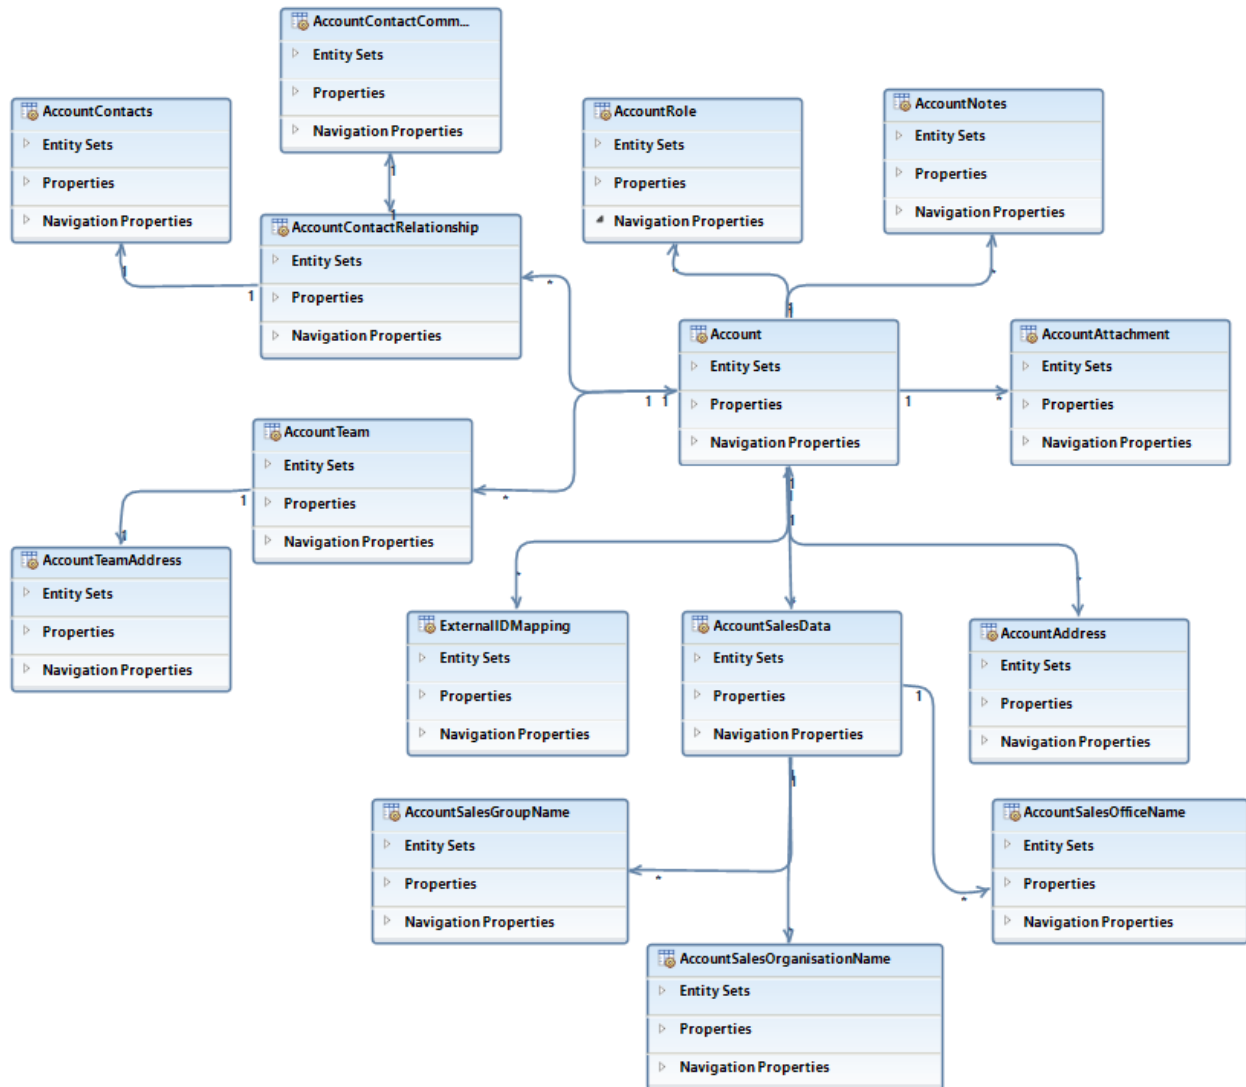

Entities cannot be created, updated or deleted in the corresponding entity sets. All entity sets based on ContextualCodeList shall be read-only. Key of the entity type includes both Code and Context.

## Properties

Name	Type	Nullable	Max Length	Fixed length	\$ Search Relevant
Code	Edm.String	false		false	
Context	Edm.String	false		false	
Description	Edm.String	false		false	

## 3.2.7 Contact Entity Type

The Contact related collections allow you to read and maintain Contacts to Accounts and their personal addresses

### 3.2.7.1 Contact Attachment

#### Overview

The ContactAttachment collection provides information about various attachments such as Documents, Images etc. associated to a particular contact.

## Top Level Entity

Contact

### Properties

Name	Type	Nullable	Max Length	Fixed length	\$Search Relevant

## 3.2.12 Lead Entity Type

The lead related collections allow you to read and maintain sales leads and related data such as products, parties involved and business transaction document references.

### 3.2.12.1 Lead

#### Overview

The Lead collection(**LeanLead**) represents an individual or organization that a company has the potential to do business with and is based on a similar SAP CRM functionality.

## 3.2.16.8 Product Sales Organisation

### Overview

The ProductSalesOrganisation collection provides the Sales Organization Information ID of their corresponding Product

### Top Level Entity

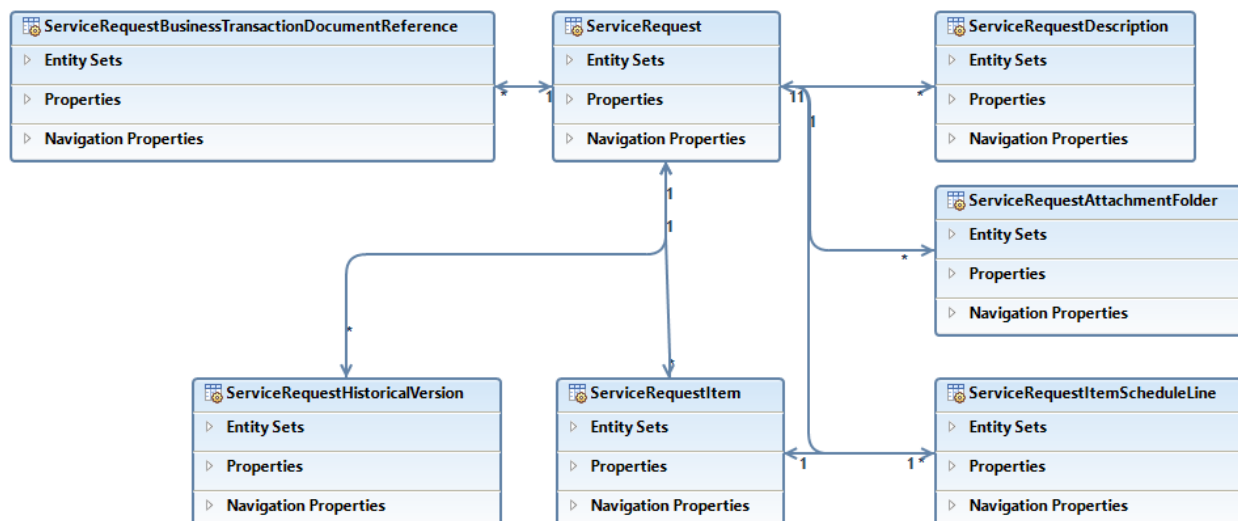

Product

### Properties

Name	Type	Nullable	Max Length	Fixed length
ObjectID	Edm.String	true	70	true

## 3.2.17 Service Request Entity Type

The ServiceRequest related collections allow you to read and maintain information about ServiceRequest list of open, completed and in process tickets.

## 3.2.17.1 Service Request

### Overview

The ServiceRequest collection provides information about list of open, completed and in process tickets. Multiple tasks can be performed on tickets such as creation, assignment of ticket, status change, adding notes, priority change etc.

### Properties

Name	Type	Description
ActivityCategoryName	c4codata.MEDIUM_Name	Indicates the type of response action made on the ticket
ActivityServiceIssueCategoryID	Edm.String	Indicates the activity level service category assigned to the ticket
ApprovalStatusCode	Edm.String	Indicates the approval status of the ticket:  1- Not Started  2 - Approval Not Necessary  3- In Approval  4- Approved  5 - Rejected  6 - In Revision  7 - Withdrawn
ApprovalStatusCodeText	Edm.String	Stores the text for the above mentioned codes
AssignedTo	Edm.String	Indicates to whom the ticket is assigned.
AssignedToName	c4codata.ENCRYPTED_LONG_Name	Specify to whom you wish to assign the ticket.
CauseCategoryName	c4codata.MEDIUM_Name	Indicates the cause of the issue raised by the ticket
CauseServiceIssueCategoryID	Edm.String	Indicates the cause level service category assigned to the ticket

Name	Type	Description
ChangedBy	Edm.String	Indicates the user who has made the changes.
CompletedOnDate	Edm.DateTime	Indicates the date on which the ticket was addressed completely
CompletionDueDate	Edm.DateTime	Indicates the due date for addressing the ticket
Contract	Edm.String	Specify the relevant contract person for the ticket
ContractID	Edm.String	Indicates the relevant contract ID for the ticket
CreatedBy	Edm.String	Indicates the user who has created the ticket
CreationDate	Edm.DateTime	Indicates the date of creation of the ticket
CreationDateTime	Edm.DateTimeOffset	Indicates the date and time of the ticket
Customer	Edm.String	Indicates the customer who owns the ticket
CustomerID	Edm.String	Indicates the customer ID for the ticket
DataOriginTypeCode	Edm.String	Indicates the origin of the data present in the ticket:  1 - Manual Data Entry 4 - Internet  5 - E-Mail 6 - Social Media 7 - Chat 8 - Telephony
DataOriginTypeCodeText	Edm.String	Stores the text for the above mentioned codes
EscalationStatus	Edm.String	Indicates the escalation status of the ticket
EscalationStatusText	Edm.String	Indicates the escalation description for the escalation status ticket
ID	Edm.String	Indicates the formatted name of the customer
IncidentCategoryName	c4codata.MEDIUM_Name	Indicates the incident raised in the ticket

Name	Type	Description
IncidentServiceIssueCategoryID	Edm.String	Indicates the incident level service category assigned to the ticket
InitialResponseDate	Edm.DateTime	Indicates the date on which the ticket was initially responded to
InitialReviewDueDate	Edm.DateTime	Indicates the due date for initial review of the ticket
InstallationPointID	Edm.String	Indicates the ID of the installation point of the product for which the ticket was raised
InstalledBaseID	Edm.String	Indicates the ID of the base where the product, for which the ticket was raised, is present.
ItemListServiceRequestExecutionLifeCycleStatusCode	Edm.String	Indicates the status of the ticket:  1 - Open 2 - In Planning 3 - Ready 4 - Partially Ready 5 - Started 6 - Finished 7 - Not Relevant
ItemListServiceRequestExecutionLifeCycleStatusCodeText	Edm.String	Stores the text for the above mentioned codes
LastChangeDate	Edm.DateTime	Indicates the date on which the latest changes were made to the ticket
LastChangeDateTime	Edm.DateTimeOffset	Indicates the date and time on which the latest changes were made to the ticket
LastResponseOnDate	Edm.DateTime	Indicates the date on which the last response was made on the ticket
Name	c4codata.EXTENDED_Name	Indicates the subject of the ticket
NextResponseDueDate	Edm.DateTime	Indicates the due date for the next response on the ticket

Name	Type	Description
ObjectCategoryName	servicerequest.MEDIUM_Name	Indicates the object mentioned in the ticket
ObjectID	Edm.String	Indicates the unique hexadecimal ID for the ticket
ObjectServiceIssueCategoryID	Edm.String	Indicates the object level service category assigned to the ticket
ParentServiceRequest	Edm.String	Indicates the parent service request for the ticket
Partner	Edm.String	Indicates the partner who has raised the ticket on behalf of the customer
PartnerID	Edm.String	Indicates the partner ID who has raised the ticket on behalf of the customer
ProcessingTypeCode	Edm.String	Indicates the type of processing done on the ticket:  SRRE - Employee Support Ticket  SRRQ - Service Request  ZCLM - Claim (Z)  ZHRQ - Employee Support (Z)
ProcessingTypeCodeText	Edm.String	Stores the text for the above mentioned codes
ProductCategoryDescription	Edm.String	Indicates the description of the product category used in the ticket
ProductID	Edm.String	Indicates the product ID used in the ticket
ReferenceDate	Edm.DateTime	Indicates the date of reference for the ticket
ReportedForEmail	Edm.String	Indicates the E-Mail ID of the party on behalf of which the ticket was raised
ReportedForPartyID	Edm.String	Indicates the party ID on behalf of which the ticket was raised
ReporterEmail	Edm.String	Indicates the E-Mail ID of the party who raised the ticket
ReporterPartyID	Edm.String	Indicates the Party ID who raised the ticket

Name	Type	Description
RequestAssignmentStatusCode	Edm.String	Indicates the request assignment status code for the ticket
RequestAssignmentStatusCodeText	Edm.String	Indicates the request assignment status code text for the ticket
RequestedEnd	Edm.String	Indicates the requested end for the ticket t
RequestedEndTimeZoneCode	Edm.String	Indicates the requested end time zone for the ticket
RequestedStart	Edm.String	Indicates the requested start date for the ticket
RequestedStartTimeZoneCode	Edm.String	Indicates the requested end time zone for the ticket
RoleCode	Edm.String	Indicates the role code for the ticket
RoleCodeText	Edm.String	Indicates the role code text for the ticket
SalesTerritoryID	Edm.String	Indicates the territory ID for sales
SerialID	Edm.String	Indicates the serial ID assigned to the ticket
ServiceAndSupportTeam	Edm.String	Indicates the service and support team for the ticket
ServiceCategoryName	c4codata.MEDIUM_Name	Indicates the type of service required for the Ticket
ServiceIssueCategoryID	Edm.String	Indicates the service level service category assigned to the ticket
ServiceLevelAgreement	Edm.String	Indicates the service level agreement for the ticket
ServicePriorityCode	Edm.String	Indicates the priority of the ticket:  1 - Immediate  2 - Urgent  3 - Normal  7 - Low
ServicePriorityCodeText	Edm.String	Stores the text for the above mentioned codes
ServiceRequestClassificationCode	Edm.String	Stores the classification code for the above mentioned codes

Name	Type	Description
ServiceRequestClassificationCodeText	Edm.String	Stores the classification code text for the above mentioned codes
ServiceRequestLifeCycleStatusCode	Edm.String	Indicates the user life cycle status code for the ticket:  1 - Open  2 - In Process  4 - Customer Action  5 - Completed  6 - Closed
ServiceRequestLifeCycleStatusCodeText	Edm.String	Stores the text for the above mentioned codes
ServiceRequestUserLifeCycleStatusCode	Edm.String	Stores the user life cycle status code for the above mentioned codes
ServiceRequestUserLifeCycleStatusCodeText	Edm.String	Stores the user life cycle status code text for the above mentioned codes
ServiceTechnician	Edm.String	Indicates the service technician for the ticket
ServiceTechnicianTeam	Edm.String	Indicates the service technician team for the ticket
WarrantyDescription	Edm.String	Indicates the description of the warranty applicable
WarrantyFrom	Edm.DateTime	Indicates the start date of the warranty
WarrantyTo	Edm.DateTime	Indicates the end date of the warranty

## 3.2.19 TimeEntry

The TimeEntry Entity Type has three entities namely the [TimeEntry](#), [TimeEntryItem](#) and the [TimeReport](#). These entities are used in time recording.

### 3.2.19.1 Time Entry

The Time Entry collection is used to maintain time entry of employees. Time entry is an object where an employee can record his time against his activities for a particular day.

Properties

Name	Type	Description	Search Relevant
AutoTimeRecordingIndicator	Edm.Boolean		
BillingRelevanceIndicator	Edm.Boolean	Indicates whether the time entry is Billing Relevant or not.	
BusinessTransactionDocumentTypeCode	Edm.String		
BusinessTransactionDocumentTypeCodeText	Edm.String	Indicates the date for which the time entry is recorded.	

Name	Type	Description	Search Relevant
Date	Edm.DateTime		
Description	c4codata.EXTENDED_Name	Indicates the description for the time entry.	
Duration	Edm.String	Indicates the duration of the work logged in the time entry.	
EmployeeUUID	Edm.Guid	Indicates the UUID for the employee for which the time entry is created.	
EndDateTime	Edm.Time	Indicates the End date and time for the time entry.	
HeaderReferenceUUID	Edm.Guid	Indicates the UUID for the Service Ticket for which the time entry is recorded.	
ItemReferenceUUID	Edm.Guid		
LifeCycleStatusCode	Edm.String	Specifies the Status of the time entry. 1. In Preparation 2. Approval Pending 3. Approved 4. Rejected 5. Released 6. In Approval	
LifeCycleStatusCodeText	Edm.String	Indicates the description for the status of the time entry.	
ObjectID	Edm.String	Indicates the unique hexadecimal id for time entry.	
StartDateTime	Edm.Time	Indicates the Start date and time for the time entry.	
TimeReportUUID	Edm.Guid	Indicates the UUID for the time report corresponding to this time entry.	
TimeTypeCode	Edm.String	Indicates the Time Type Code: 1. Working Hours 2. Non-Working Hours	

Name	Type	Description	Search Relevant
TimeTypeCodeText	Edm.String	Indicates the description for the Time Type Code.	
TimeZone	Edm.String	Indicates the time zone of the time entry recorded.	
TimeZoneText	Edm.String	Indicates the description of the time zone for the time entry recorded.	

#### Navigations

Name	From Entity	To Entity	Cardinality
Employee	TimeEntry	Employee	0..1
ServiceRequest	TimeEntry	ServiceRequest	0..1
TimeEntryItem	TimeEntry	TimeEntryItem	0..*
TimeReport	TimeEntry	TimeReport	0..1

## 3.2.19.2 TimeEntryItem

The Time Entry Item collection is used to maintain time entry items related to the particular time entry. We can have multiple time entry items for a time entry.

#### Properties

Name	Type	Nullable	Creatable	Updatable	Filterable
ID	Edm.String	True	True	True	True
ObjectID	Edm.String	True	False	False	True
ParentObjectID	Edm.String	True	False	False	True
ProductID	Edm.String	True	True	True	True

Navigations

Name	From Entity	To Entity	Cardinality
TimeEntry	TimeEntryItem	TimeEntry	1

### 3.2.19.3 TimeReport

The Time Report collection is used to maintain time reports of employees. You can use it to group time entries for an employee for a time period.

Properties

Name	Type	Description	\$ Search Relevant
Description	c4codata.EXTENDED_Name		
EmployeeUUID	Edm.Guid	Indicates the UUID for the employee for which the time report is created.	
EndDate	Edm.DateTime	Indicates the End Date of the time report.	
ObjectId	Edm.String	Indicates the unique hexadecimal id for time report.	
RejectionReason	c4codata.Text	Indicates the reason for rejection of the time report.	
ReportName	c4codata.EXTENDED_Name	Indicates the name and language code for the time report.	

Name	Type	Description	\$ Search Relevant
StartDate	Edm.DateTime	Indicates the End Date of the time report.	
Status	Edm.String	Indicates the status of the Time Report. <ul style="list-style-type: none"> <li>• In Preparation</li> <li>• Approval Pending</li> <li>• Approved</li> <li>• Rejected</li> <li>• In Approval</li> </ul>	
StatusText	Edm.String	Indicates the description for the status of the time report.	
TotalDuration	Edm.String	Indicates the total duration of the time report.	
Navigations			
Name	From Entity	To Entity	Cardinality
Employee	TimeReport	Employee	0..1
TimeEntry	TimeReport	TimeEntry	0..*

## 3.2.20 User Entity Type

The User Entity Type collection is a Single Entity Type. The EntityGroup description are not required.

## 3.2.20.1 User

### Overview

The User collection provides information about all the user details.

### Request Elements

### 3.2.22 Marketing Attributes Entity Type

Marketing attributes are associated to master data objects like accounts and contacts. They allow users to define and maintain name value pairs for master data. They are similar to marketing attributes in SAP CRM.

There are two parts to maintaining marketing attributes:

1. Create and maintain definitions.  
This involves creating marketing attributes and marketing attribute sets and assigning the marketing attributes to marketing attribute sets. It also involves MarketingAttribute and MarketingAttributeSet ODATA services.
2. 2. Assignment of marketing attribute sets to master data objects and maintaining attribute values.  
This is done using the marketing attribute assignment ODATA service.

#### 3.2.22.1 Marketing Attribute (BusinessAttribute)

Attribute definition

## Properties

Name	Type	Nullable	Max Length	Fixed length	Search Relevant
Marketing Attribute ID (ID )	Edm.String	true	30	true	
Number of Characters (Character-NumberValue)	Edm.Int16	true		true	
Number of Decimal Places (DecimalNumberValue)	Edm.Int16	true			
Status (LifeCycleS-tatusCode)	Edm.String	false	1	true	
Unit of Measure (MeasureUnitCode)	Edm.String	true	5	true	
Format (RepresentationFormatCode)	Edm.String	true	4	true	
Name	Edm.String	true	255	true	
languageCode	Edm.String	true	1	true	
Mandatory Indicator	Edm.Boolean	true			
Multivalue Indicator	Edm.Boolean	true			
Negative Allowed Indicator	Edm.Boolean	true			
Case Sensitive Indicator	Edm.Boolean	true			
Interval Allowed Indicator	Edm.Boolean	true			

## Navigations

Name	FromEntity	ToEntity	Cardinality
BusinessAttributeCharacteristic	Marketing Attribute	BusinessAttributeCharacteristic	0.. *
BusinessAttributeDescription	Account	BusinessAttributeDescription	1.. *
BusinessAttributeValueList	Account	BusinessAttributeValueList	0.. *

### 3.2.22.2 Marketing Attribute Description (BusinessAttributeDescription)

#### Properties

Name	Type	Nullable	Max Length	Fixed length	Search Relevant
Name	Edm.String	true	255	true	
languageCode	Edm.String	true	1	true	

### 3.2.22.3 Marketing Attribute Value List (BusinessAttributeValueList)

#### Properties

Name	Type	Nullable	Max Length	Fixed length	Search Relevant
ID	Edm.String	true	30	true	
Name	Edm.String	true	255	true	
languageCode	Edm.String	true	1	true	

### 3.2.22.4 Marketing Attribute Value List Description (BusinessAttributeValueListDescription)

#### Properties

Name	Type	Nullable	Max Length	Fixed length	Search Relevant
Name	Edm.String	true	255	true	
languageCode	Edm.String	true	1	true	

### 3.2.22.5 Marketing Attribute Set (BusinessAttributeSet)

Group attributes into attribute sets

#### Properties

Name	Type	Nullable	Max Length	Fixed length	Search Relevant
Marketing Attribute Set ID (BusinessAttributeSetID)	Edm.String	true	18	true	
Object Type Code (ObjectTypeCode)	Edm.String	true	15	true	
Organization Relevant (OrganizationRelevanceIndicator)	Edm.Boolean	true			
Person Relevant (PersonRelevanceIndicator)	Edm.Boolean	true			
Status (LifecycleStatusCode)	Edm.String	false	1	true	
Name	Edm.String	true	40	true	
languageCode	Edm.String	true	1	true	

### 3.2.22.6 Marketing Attribute Set Description (BusinessAttributeSetDescription)

To be used if attribute set descriptions exist in more than one language

#### Properties

Name	Type	Nullable	Max Length	Fixed length	Search Relevant
Name	Edm.String	true	40	true	
languageCode	Edm.String	true	1	true	

### 3.2.22.7 Marketing Attribute Set Attribute Assignment (BusinessAttributeSetAttributeAssignment)

Assignment of marketing attributes to marketing attribute sets

#### Properties

Name	Type	Nullable	Max Length	Fixed length	Search Relevant
Marketing Attribute ID (ID )	Edm.String	true	30	true	

### 3.2.22.8 Marketing Attribute Assignment (BusinessAttributeAssignment)

Assignment of marketing attributes to master data objects such as accounts or contacts.

#### Properties

Name	Type	Nullable	Max Length	Fixed length	Search Relevant
Object Type Code (ObjectTypeCode)	Edm.String	true	15	true	
Business Partner ID	Edm.String	true	18	true	
Business Partner External Key	Edm.String	true	100	true	true

#### Note

Object Type Code has been removed in the 1711 release and the solution adds the required default value for this property.

### 3.2.22.9 Marketing Attribute Assignment Item (BusinessAttributeAssignmentItem)

#### Properties

Name	Type	Nullable	Max Length	Fixed length	Search Relevant
Business Attribute Set ID	Edm.String	true	18	true	
Business Attribute ID	Edm.String	true	30	true	
Attribute Value	Edm.String	true	255	true	
Business Partner ID	Edm.String	false	10	true	true

## 3.2.23 HTTP Status Codes

HTTP SUCCESS CODE	DESCRIPTION
200 OK	The requested resource retrieval is successful, and a full payload of the requested resource is returned.
HTTP ERROR CODES	DESCRIPTION
400 Bad Request	The server could not understand the request due to malformed syntax.
403 Forbidden	Access to the resource you are trying to connect to is forbidden. This may be due to either a user authentication failure or to the user having insufficient privileges to perform the action.
404 Not Found	The server cannot find the specified resource. This is typically due to an unrecognized resource ID (such as userId, groupId, or contentId).
405 Method Not Allowed	The method specified in the Request Line is not allowed for the resource identified by the Request URI.
409 Conflict	There is an internal access conflict to the specified resource.
429 Too Many Requests	The user has sent too many requests in a given period of time. This error message is typically encountered if API rate limits, set to protect against DoS attacks and to preserve server responsiveness, have been exceeded. See Rate Limits to view the established limits.
500 Internal Server Error	The server encountered an unexpected condition, which prevented it from fulfilling the request.
501 Not Implemented	The server does not support the functionality required to fulfill the request.

## 3.2.24 Service Assignment Entity Type

### Overview

The ServiceAssignment OData service enables the external application or user to perform the following actions:

1. Query all the Assignments.
2. Read Assignments by Assignment UUID.
3. Change the value of Status.

## Properties

Name	Type	Description	Search Relevant
ID	Edm.String	Indicates Assignment ID	Yes
AssignmentUUID	Edm.Guid	Indicates UUID of the Assignment	Yes
BusinessActivityUUID	Edm.Guid	Indicates the business activity UUID of the assignment	
CreatedBy	Edm.String	Indicates the user who has created the assignment	
CreationDateTime	Edm.DateTimeOffset	Indicates the date of creation of the assignment	
LastChangedBy	Edm.String	Indicates the user who has made the changes	
Customer	Edm.String	Indicates the customer party for the assignment	Yes
CustomerID	Edm.String	Indicates the customer ID for the assignment	Yes
CustomerTypeCode	Edm.String	Indicates the customer role type code for the assignment	
DivisionCode	Edm.String	Indicates the Division code for the assignment	
StartDateTime	Edm.DateTimeOffset	Indicates the scheduled start date time for the assignment	Yes
StartDateTimeZoneCode	Edm.String	Indicates the scheduled start date time timezone code for the assignment	Yes
EndDateTime	Edm.DateTimeOffset	Indicates the scheduled end date time for the assignment	Yes
EndDateTimeZoneCode	Edm.String	Indicates the scheduled end date time timezone code for the assignment	Yes

Name	Type	Description	Search Relevant
Fixed	Edm.String	Indicates the fixed state of the assignment:  1. Fixed Time 2. Fixed Time & Technician	
Released	Edm.String	Indicates the released state of the assignment::  1. Released <space> - Not Released	Yes
FullDayIndicator	Edm.Boolean	Indicates all day indicator:  X – True  <space> - False	
LifeCycleStatusCode	Edm.String	Indicates the status of the assignment:  1. Open 2. In Process 3. Completed 4. Canceled	
OrganizerID	Edm.String	Indicates the organizer ID for the assignment	
OrganizerName	Edm.String	Indicates the organizer name for the assignment	
OrganizerTypeCode	Edm.String	Indicates the organizer party type code for the assignment	
PrimaryContact	Edm.String	Indicates the contact for the assignment	
PrimaryContactID	Edm.String	Indicates the contact party ID for the assignment	
PrimaryContactTypeCode	Edm.String	Indicates the contact party type code for the assignment	
Priority	Edm.String	Indicates the priority of the assignment:  1. Immediate 2. Urgent 3. Normal 4. Low	Yes

Name	Type	Description	Search Relevant
ProcessingTypeCode	Edm.String	Indicates the type of processing done on the activity:  AACT – Assignment Activity	
ServiceTechnician	Edm.String	Indicates the service technician for the assignment	
ServiceTechnicianID	Edm.String	Indicates the service technician ID for the assignment	
ServiceTechnicianTypeCode	Edm.String	Indicates the service technician party type code for the assignment	
Status	Edm.String	Indicates the external status of the assignment	Yes
Subject	Edm.String	Indicates the subject of the assignment	Yes
TypeCode	Edm.String	Indicates the type code for the assignment  2215 – Assignment Activity	
ReferenceDocumentID	Edm.String	Indicates Document ID of the reference document for the assignment	
ReferenceDocumentTypeCode	Edm.String	Indicates the Document type code of the reference document for the assignment	
ReferenceDocumentUUID	Edm.Guid	Indicates the document UUID of the reference document for the assignment	
ReferenceDocumentItemID	Edm.String	Indicates the item id of the reference document for the assignment	
ReferenceDocumentItemTypeCode	Edm.String	Indicates the item type code of the reference document for the assignment	
ReferenceDocumentItemUUID	Edm.Guid	Indicates the item UUID of the reference document for the assignment	

## Navigation

Name	From Entity	To Entity
ServiceAssignmentBusinessTransaction- DocReference	ServiceAssignment	ServiceAssignmentBusinessTransaction- DocReference
ServiceAssignmentNotes	ServiceAssignment	ServiceAssignmentNotes

### 3.2.24.1 Business Context and Use

The Service Assignment OData service enables you to connect external applications to your SAP Cloud for Customer system and to read and query assignment data within your system.

EntityType Name = *ServiceAssignment*

Access our solution tenant using this example:

[https://<C4C-tenant>/sap/c4c/odata/v1/c4codata/\\$metadata](https://<C4C-tenant>/sap/c4c/odata/v1/c4codata/$metadata)

Assignment OData Service enables the external application or user to perform the following action:

1. Query all the Assignments.
2. Read Assignments by Assignment UUID.
3. Change the value of Status.

### 3.2.24.2 Service Assignment Notes

This topic provides you with property values for the **ServiceAssignmentNotes** object.

## Overview

**ServiceAssignmentNotes** provides information about the assignment. The text can be viewed, created, and updated.

## Properties

Properties of ServiceAssignmentNotes

Name	Type	Description
ParentObjectID	Edm.String	Indicates the ObjectID of the parent which is the Assignment ObjectID
ObjectID	Edm.String	Indicates the notes' UUID
TypeCode	Edm.String	Indicates the type code of the notes. The type code of the Assignment notes is 10002
LanguageCode	Edm.String	Indicates the language code in which the note has been added
CreatedOn	Edm.DateTime	Indicates the time (and date) of the creation of the note
UpdatedOn	Edm.DateTime	Indicates the time (and date) at which the note was last updated
CreatedBy	Edm.String	Indicates the User ID of the creator of the note
LastUpdatedBy	Edm.String	Indicates the User ID of the last updater of the note
AuthorName	Edm.String	
AuthorUUID	Edm.Guid	

### 3.2.25 API Strategy

We have updated our API strategy based on feedback received from customers.

Here is a summary of what this update means to you:

1. The following APIs will be permanently deprecated as of release February 2020:
  - Standard synchronous inbound SOAP web services (A2X)
  - SAP Cloud for Customer OData API v1

#### ⓘ Note

It is highly recommended to not use these APIs in any new projects. These APIs have the following behavior:

- They continue to work and are supported in existing implementations.
- They are not enhanced beyond bug fixes.

2. The following APIs continue to be supported:
  - Standard asynchronous inbound SOAP web services (A2A)
  - Custom SOAP and Custom OData APIs
3. We recommend the following to all customers:
  - Use [SAP Cloud for Customer OData API v2](#) in your new implementations.
  - Consider adapting [SAP Cloud for Customer OData API v2](#) in any existing implementations that are based on deprecated (and soon to be obsolete) APIs.

## 4 OData Service Explorer

This document provides an overview of the OData Editor and how you can use this editor to create OData services. The OData Service Explorer view in the [Administrator](#) work center allows you, as an end user to create, edit, and manage your OData services.

This view also lists the services that are created by you and the standard OData services offered by SAP. To view the services created by you, select [Custom OData Services](#) from [Show](#).

To view [SAP OData Services](#), select [SAP OData Services](#) from [Show](#).

In the [Custom OData Services](#) view, you can also download an OData service, by selecting a service and clicking [Download](#). Additionally you can download services in patches for testing by clicking [Patch Download](#). This functionality can be used if a patch solution exists in the system. The following table explains the criteria for [Download](#) and [Patch Download](#)

Download	Patch Download
Only if an original solution exists in the source system, download the service using the <a href="#">Download</a> button.	The patch solution can be used only if it exists in the source system, for all the original solution business objects and fields of an OData service.
During a download, the fields of the patch solution are replaced with fields of the original solution.	During a <a href="#">Patch Download</a> , only the patch solution fields are downloaded. If there are fields from the original solution, they are renamed to point to the patch solution.
	For a successful upload, the target system should have the patch solution.

### 4.1 Creating an OData Service

1. In the SAP Cloud for Customer system, navigate to the [Administrator](#) work center, [OData Service Explorer](#) view and select [Custom OData Services](#) from Show.

#### ① Note

The [SAP OData Services](#) are default services that are provided by SAP and can only be viewed but not edited. You can only edit [Custom OData Services](#).

2. Select [Data Workbench](#).

#### ① Note

If this option is selected, the External Keys for the various entities for the service is enabled.

3. Click [New](#) and enter the [OData Service Name](#) in the [Quick Create](#) dialog box.
4. Click [Save and Close](#) to save the service or [Save and Open](#) to complete the service or [Save and New](#) to save this service and create a new service. The OData service is set to **Inactive** after the service has been created.

#### Note

When you create custom OData services, it is important to ensure that necessary authorizations are enabled for the services. For more information, see [Authorization \[page 6\]](#).

## 4.1.1 Adding an Entity

Add an entity to a custom OData service.

1. From the [OData](#) view, select the OData service that you created and click [Edit](#).
2. Select the [Include Code Descriptions](#) and select the checkbox, if you want to add the description of the code list to your OData service. Enter the [Work Center View](#) for users with this work center view to see the OData service.

### ODATA EDITOR

Service Name: **zvik\_test** Status: **Inactive**

Save and Close

Save

Close

Activate

Include Code Descriptions: ☐

Work Center View:

#### Note

The [Include Code Descriptions](#) setting applies to the entire OData Service. The [Work Center View](#) selection applies only to this entity.

3. Click [Select Business Object](#) and enter the [BO Name](#) and [BO Node Name](#) . Click [OK](#).

### SELECT BUSINESS OBJECT

BO Name:

BO Node Name:

OK Cancel

### Note

Standard business objects do not include nodes to create new entity types. However, field extensions are available.

4. Select the relevant node for the entity from the [Entity Types](#) tab.

Entity Types

Function Imports

Activity

Select Business Object

	Name	Select
	Root	<input checked="" type="checkbox"/>

5. Select the relevant elements that are listed under the node.

CustomOData

Select Business Object

Create Entity Type

	Name	Select
	Root	<input checked="" type="checkbox"/>
	date	<input checked="" type="checkbox"/>
	ID	<input checked="" type="checkbox"/>
	quantity	<input checked="" type="checkbox"/>
	SAP_UUID	<input type="checkbox"/>
	node_level1	<input type="checkbox"/>
	TextCollection	<input type="checkbox"/>

### Note

The selected nodes elements are automatically populated under the [OData Service](#) structure. The entity has a default property called [ObjectID](#), which is the node ID of the corresponding business object. Additionally, you can delete an entity type by selecting it and clicking [Remove](#).

The following table explains some of the key node elements:

Node Element	Description
Create Associated Entity	A create associated entity that cannot be merged with any other entity and is shown as a separate entity below the host entity.

Node Element	Description
Merge Association	A merge association entity can be merged with the active entity. However merging entities is optional. If you do not want to merge the entity, the system automatically creates an entry below the host entity.
Dependent Object Association	A dependent object association creates a new entity that corresponds to the respective dependent object. The properties under this object cannot be edited. For example, <a href="#">Text Collection</a> and <a href="#">Attachment Folder</a> .

If you create a new entity using an association, the navigation between the entity and element is added automatically to both, it is bidirectional. If the association is between cross business objects, the navigation is not bidirectional.

If you have selected [Data Workbench](#), while creating a service, you can see two additional properties [ExternalKey](#) and [ParentExternalKey](#) added to the entity structure.

## OData Service

[Remove](#)

	Selected	Name	Key	Cr...	Up...
▼ 	<input checked="" type="checkbox"/>	CustomODataRoot	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
■ 	<input type="checkbox"/>	date	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
▶ 	<input type="checkbox"/>	ObjectID	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
▶ 	<input type="checkbox"/>	ID	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
▶ 	<input type="checkbox"/>	quantity	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
▶ 	<input type="checkbox"/>	CustomODatanode_level1	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
▶ 	<input type="checkbox"/>	CustomODatanode_level2	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
▶ 	<input type="checkbox"/>	CodeList	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
▶ 	<input type="checkbox"/>	MaterialSalesProcessInformation	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
▶ 	<input type="checkbox"/>	CustomODataTextCollection	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

If you create an entity by clicking the [Select Business Object](#), the navigations are created automatically between existing entities and the newly created entity.

6. Enter the following information under the *Properties* and *Navigation Properties* respectively:

Properties

DATE

Null:

☒

Filter:

☐

Name:

Maximum Length:

Precision:

Scale:

Default Value:

Type:

Path:

UI Element	Description
Delete	Selecting this option would delete the selected entity type.
Name	Enter the name of the entity type. This field can be edited and a new name can be given.
Work Center View	Enter the work center or view to which the end user should have authorization, in order to view the data.
Title Property (Entity)	The title can be mapped to the property of an entity that can be mapped to elements and attributes of an entry or to custom elements of an entry in the feed.
Entity Set	Name of the entity set entered in the OData service.
Entity Set	Name of entity sets are relevant for fields of type Code. It includes code and description that references the entity type <a href="#">Codelists</a>
Null	Select this option if you want the property to have a null value.
Name	Enter the name of the property. One entity type cannot have two properties with same name.
Maximum Length	Shows the maximum length of the property value.
Scale	Enter the number of digits to the right of the decimal place for the property value.

UI Element	Description
Default Value	Enter the default value of the property. In the case of READ, only those records that have this default value are returned. In the case of WRITE , if no value is provided, then this default value is used.
Type	Shows the type of the property. For example: <code>String</code> , <code>Guid</code> , <code>Boolean</code> , and <code>DateTime</code> . <div> <div>Note</div> <div>ComplexTypes are no longer supported for a new service.</div> </div>
Path	Shows the business object path for the property.
Title (Property)	Select this option to specify the title property in the entity type.
Enable Search	Include the selected property in the search results. This option is only for \$Search.
External Key Scheme Code	Select a scheme code for the ExternalKey of the entity. The list appears based on scoping.

7. Select [Add Row](#) from the [Function Imports](#) tab and enter the following details. However this step is optional. If you want to call a [BO Action](#) enter the following:

Entity Types

Function Imports

Function Imports [Add Row](#) | [Remove](#)

Function Import Type	Name	Entity Name	HTTP Method	BO Action / Query
QUERY	service	ServiceRequestAttachmentFolder	GET	

Parameters [Add Row](#) | [Remove](#) | [Manage Parameter](#)

Name	Mode
InstanceData	Out

1. Function Import Type - you can choose either [Action](#) or [Query](#)
2. Entity Name
3. HTTP Method
4. BO Action

#### Note

Depending on the selected entity, the Parameters are automatically populated

8. Click [Save and Activate](#).

## 4.1.2 Result

Once the service is saved successfully, the status of the OData service changes to Active and the Service URL is generated. This contains the metadata information of the OData service.

For example, [https://<customer tenant ID>/sap/c4c/odata/cust/v1/customodata/\\$metadata](https://<customer tenant ID>/sap/c4c/odata/cust/v1/customodata/$metadata)

## 4.2 Testing an OData Service

Use the OData Console to test a custom service.

The OData Console is available on click of the test button in OData Service Explorer. It lists all the SAP delivered and custom services available in the respective SAP Cloud for Customer tenant.

### Actors / Users

#### Actors / Users:

- **Key Users:** Key users are the system administrators who are responsible for managing OData Services.
- **Business Users:** Business users are the users with assigned roles and perform tasks on certain defined components.

### Key Features

ODataConsole has two key features as follows:

1. **Exploring OData Services:** This feature lets a user see all the entities that are available in the service and also presents the properties of the entities in an intuitive way.
2. **Testing OData Services:** This feature simplifies the process of testing the OData service, wherein the user can perform HTTP operations like Get, Post without getting into the finer details of syntax or authentication.

### 4.2.1 Exploring OData Services

An OData service is composed of a number of entity sets (collections), their properties, and associations (navigation). An association describes the relationship between two entity sets. The user can select a service from the selection help for the field [Service](#). The list contains all the SAP delivered and custom services available in the respective SAP Cloud for Customer tenant

When you select an entity set from the list, its properties and associations (if any) are listed under the [Entity Details](#) tab and the [Navigation Properties](#) tab respectively.

## 4.2.2 Testing OData Services

You can test the OData services through HTTP requests, for retrieving, adding and updating data for the selected entity set. You need to select the Entity of a service and then click on the *Test* tab to begin testing.

The test tab contains the Request and Response sections and these sections can be expanded and collapsed

through expand and collapse buttons on the right.

OData Console supports the following HTTP methods:

1. Get
2. Post
3. Patch
4. Put
5. Delete

The HTTP methods can be selected from the method drop down in the request section. Steps to Execute a Get Request:

1. Select a Method from the selection help, under the *Request* section.
2. In the field next to the dropdown, the URL referencing the selected OData service collection is automatically populated. You can further customize the request with the OData system query options, such as \$filter, \$search, and so on by editing the URL.
3. There are three formats in which the user can provide the body or the payload :
  1. **Form**: This tab presents the user with the properties of the entity, the user can fill the values of the properties in the text boxes in front of the labels.
  2. **XML**: This tab lets the user enter the payload in XML data format.
  3. **JSON**: This tab lets the user enter the payload in JSON format. In the Form tab, enter values for Object ID according to the properties of the collection and press execute.

You can add headers to the request using the headers tab in the request section. The application fetches an X-CSRF token automatically when executing OData requests, and it is not necessary to provide this token manually. The XML and JSON format are ideal for the key users who have created their payloads already or have got them from some other application. The form format is very useful for business users who just want to casually test and explore OData services.

The image shows three screenshots of the 'Payload' window in OData Service Explorer, illustrating different views for editing data:

- Form View:** The 'Form' tab is selected. It shows a single text input field labeled 'ObjectID' with the value '00163E02944F1ED1A6E2F7D247603D12'.
- XML View:** The 'XML' tab is selected. It displays the corresponding XML payload:
 

```
<?xml version="1.0" encoding="utf-8" standalone="yes"?>
<feed xmlns="http://www.w3.org/2005/Atom" xmlns:m="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata" xmlns:d="http://schemas.microsoft.com/ado/2007/08/dataserv">
  <entry>
    <content type="application/xml">
      <m:properties>
        <d:ObjectID>00163E02944F1ED1A6E2F7D247603D12</d:ObjectID>
      </m:properties>
    </content>
  </entry>
</feed>
```
- JSON View:** The 'JSON' tab is selected. It displays the corresponding JSON payload:
 

```
{
  "ObjectID": "00163E02944F1ED1A6E2F7D247603D12"
}
```

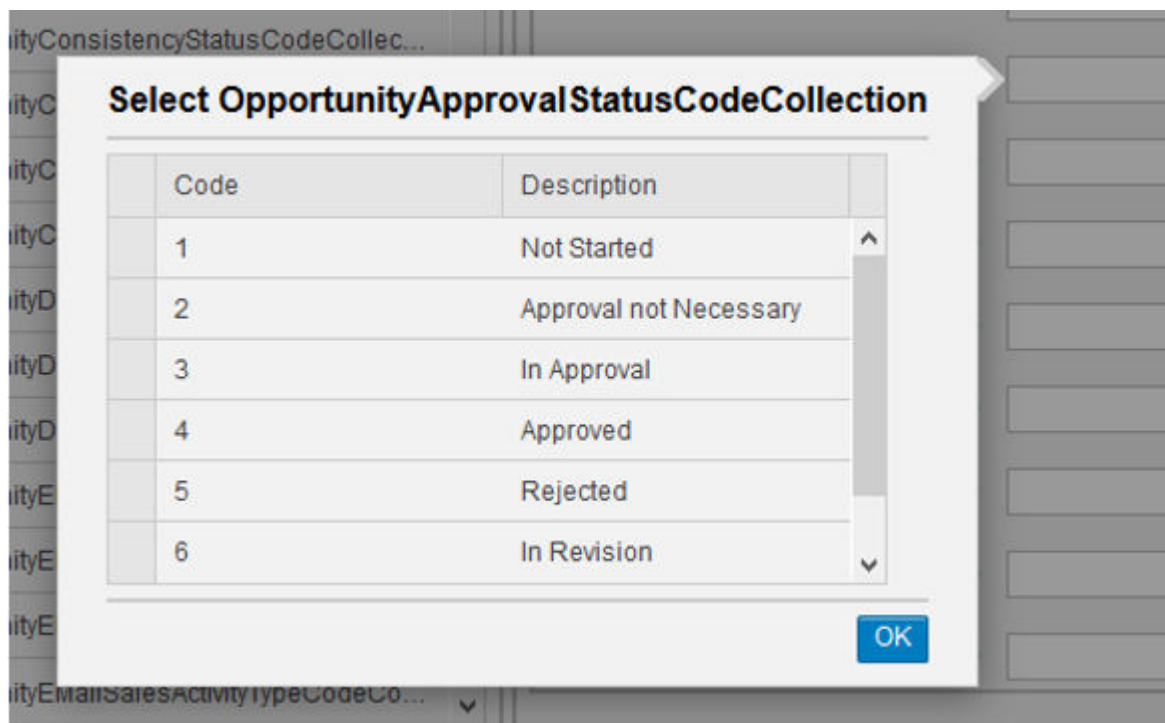

The **Form** tab in the **Request** section also supports maintaining Complex Types. As soon as the user clicks in a text box corresponding to a complex type property, a dialog screen is displayed with all the sub properties for the complex type property. When you click on **OK** button, the values that you enter are saved onto the complex type property. For example: . AccountName Property in Opportunity entity.

The image shows a dialog box titled 'Enter AccountName'. It contains two input fields:

- A field labeled 'languageCode' with the value 'E'.
- A field labeled 'content' with the value 'Pearson'.

At the bottom right of the dialog, there are two buttons: 'Ok' and 'Cancel'.

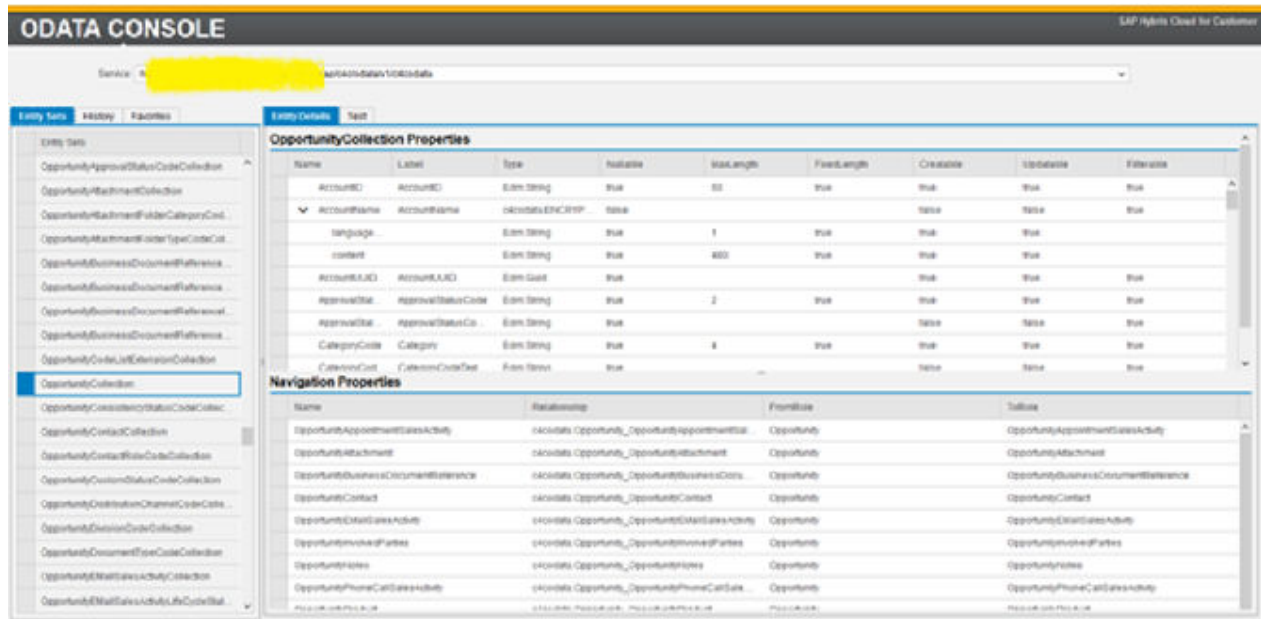

Also the **Form** tab provides the Code List help for the “**Code**” type properties that can have a set of defined values. For example: .: Approval Status Code in Opportunity Entity.

The outcome of the HTTP requests will be displayed in the [Request](#) section. The Response can be seen in three formats as well:

- **Data:** This presents the user with an excel view of the data. The values of Complex type properties is displayed in curly braces with a comma. For example: . {USD,200.000000}
- **XML:** This tab can be used to see the response body in XML format.
- **JSON:** This tab can used to view the Response in JSON format.

The XML and JSON format and ideal for the key user as they can directly copy and use these payloads in other applications. The Data format is ideal for they key users as it is very readable for lesser data and can be made sense of very quickly. The [Response](#) sections also gives an option to download data in **CSV** format which was retrieved as response from executing a Get Request. Also the user can see the response headers from the headers tab in [Response](#) section.

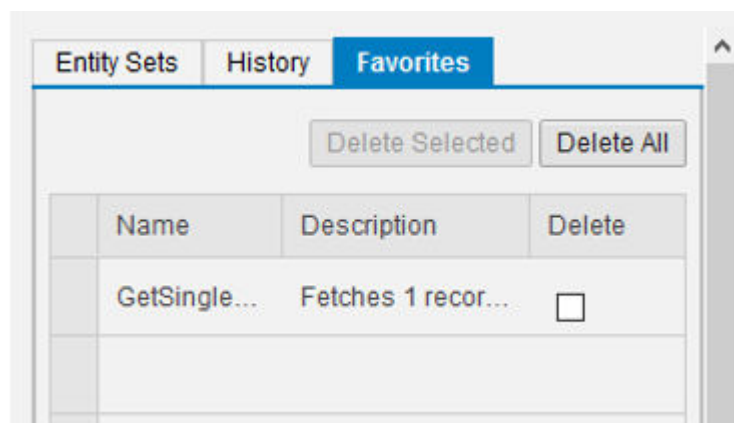

As explained above , Other HTTP requests can be executed similarly by providing all the necessary details.

### Note

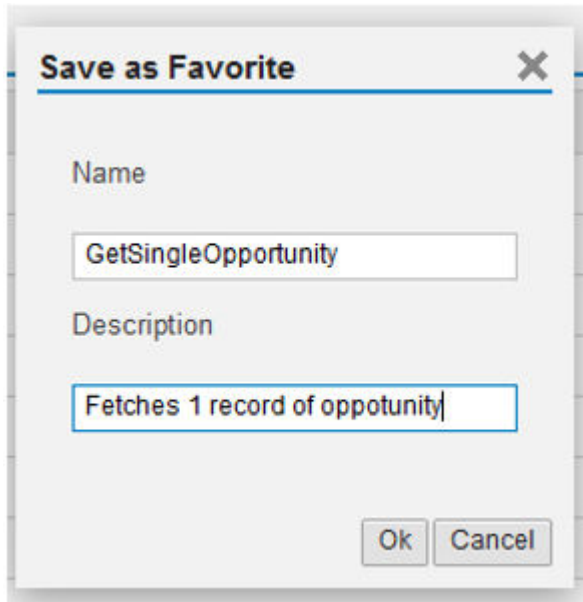

You will find the description of various HTTP methods in the **Appendix**.

## 4.2.3 Favorites

To reuse payloads, the payload for a particular request can be saved as a favorite template. In order to do so, you need to provide a name and a description for the template to be saved. Saved favorites can later be loaded by selecting under the *Favorites* tab.

You can easily create favorites by clicking on the *Save as Favorite* (adjacent to *Execute* button) in the *Test* tab. When you click the button, you are prompted to provide the name and description of the favorite; Click on **OK** to confirm.

A dialog box titled "Save as Favorite" with a close button (X) in the top right corner. It contains two text input fields. The first field is labeled "Name" and contains the text "GetSingleOpportunity". The second field is labeled "Description" and contains the text "Fetches 1 record of oppotunity". At the bottom right, there are two buttons: "Ok" and "Cancel".

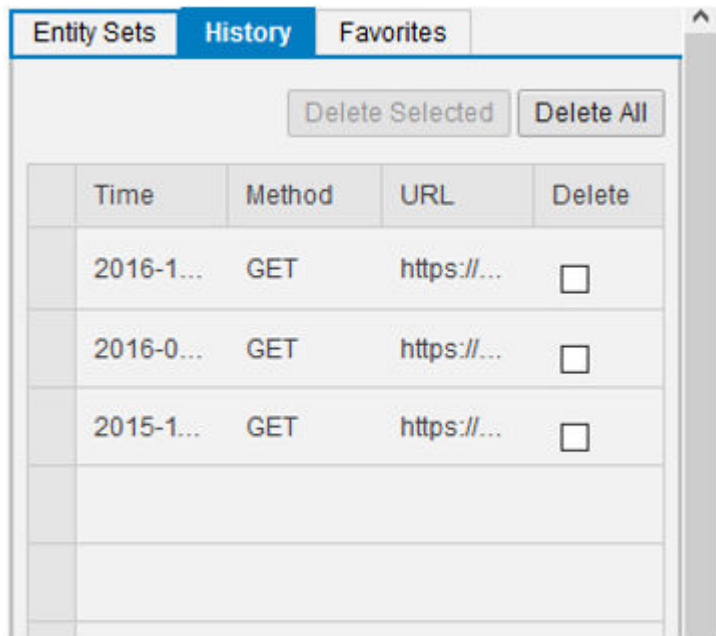

You can also delete the favorites with the help of the [Delete Selected](#) and [Delete All](#) buttons. The [Delete](#) selected deletes all the selected rows and the [Delete All](#) clears all the favorites for the logged in user.

## 4.2.4 History

The last one hundred unique requests are stored in the history so that they can be accessed and executed again later. The history entries are accessible under the [History](#) tab.

You can also delete the history with the help of the [Delete Selected](#) and [Delete All](#) buttons. The [Delete Selected](#) deletes all the selected rows and the [Delete All](#) clears all the history rows for the logged in user.

## 4.2.5 Appendix

A table of Different Http Methods and their description:

Method	Description
GET	The GET method is used to retrieve using a given URI. Requests using GET should only retrieve data and should have no other effect on the data.
POST	A POST request is used to create records for entities.
PUT	A PUT request replaces all the current representations of the target resource with the uploaded content.
DELETE	A DELETE request removes all the current representations of the target resource given by URI.
PATCH	A PATCH request replaces only the provided properties of the current representations of the target resource with the uploaded content.

## 5 OData API Monitor

You can monitor inbound OData calls with OData API Monitor.

Monitor the status of incoming calls and view the request and response payloads. This feature is useful when troubleshooting different integration scenarios.

### Scoping

OData API Monitor is available in your tenant by default. If you want to remove it, you can adjust it in your business configuration:

1. Go to [Business Configuration](#), choose the [Implementation Projects](#) view
2. Select your implementation project and click [Edit Project Scope](#).
3. In the scoping wizard, choose [Next](#) until the [Scoping](#) screen appears.
4. Go to ► [Communication and Information Exchange](#) ► [People Collaboration, Intranet and External Services](#) ► [Communities, Document Management and External Services](#) ► [OData API Monitor](#) ►
5. Answer the scoping question.

### Launch OData Monitor

Logon to SAP Cloud for Customer and go to ► [Administrator](#) ► [General Settings](#) ► [OData API Monitor](#) ► and launch.

Once activated, all inbound calls, requests and responses are logged for one hour. You can view the HTTP status code of incoming calls, time of call, user of call, HTTP method used and the path of the call. You can also select an entry and view the request and response payload.

You can deactivate the trace and filter results by defining the desired search.

## 6 (Deprecated) Setting Up OData Notifications

Configure notifications and inform external systems when there are changes to SAP Cloud for Customer business objects.

### Prerequisites

#### Note

The feature *OData: Event Notification to External Systems* is deprecated. *Event Notifications* is now available. For more information, see [SAP Cloud for Customer](#) > Integration > Event Notifications

You have scoped *Event Notification* in business configuration. To perform this step, follow these instructions:

Go to *Business Configuration, First Implementation*. In step 4 (Questions) choose, ► *Communication and Information Exchange* ► *People Collaboration, Intranet and External Services* ► *Communities, Document Management and External Services* ► Under *Group: Event Notification*, set *Do you want to use Event Notification to inform External Applications?* as *In Scope*.

### Context

This functionality notifies external systems of changes to business objects in SAP Cloud for Customer. Use this procedure to register your end points and set up authentication details. A typical use for this functionality is to send a notification to SAP Commerce Cloud when a new employee is created in your C4C system, or to notify custom applications of changes to business objects.

### Procedure

1. If your HTTPS enabled endpoint uses certificates, add certificates used to the solution certificate list. Find this list under ► *Administrator* ► *Common Tasks* ► *Edit Certificate Trust List* ►.
2. Navigate to the ► *Administrator* ► *General Settings* ► work center.
3. Choose *OData Event Notification to External Systems* under the *Custom Object Builder* section.
4. Click *Add Row* under *Consumers*, and provide the *Name* and *Consumer End Point*.

Your consumer end points must be in the public domain, must use HTTPS protocol, and must be in front of any firewalls in your network. Additionally, consumer end points must be running an application that can

understand and persist the following four fields: **businessObject**, **businessObjectID**, **odataServiceEndpoint**, **event**.

#### → Remember

If the consumer end point is behind a firewall the connection check will fail.

5. Select *Basic Authorization*.
6. Click *Add Row* under *Subscriptions*.
7. Select the *Business Object*, *OData Service*, *OData Entity Collection*, and the event type (create, update, delete).
8. Choose a consumer endpoint in the table, and then select *Check connection*.
  - If the connection test succeeds, then the solution will send OData Notifications to your endpoint.
  - If the connection test fails, then check that your endpoint is not behind a firewall and that you have added the certificates used by the endpoint into the certificate list.
9. Click *Save*.

## Results

When business objects listed under any of the subscriptions are modified, the external consumer is called asynchronously.

Example payload in JSON format:

```
{ "businessObject": "CUSTOMER", "businessObjectId": "00163E08BFEC1ED785AE497656AA26FE", "odataServiceEndpoint": "https://my123456.ondemand.com/sap/byd/odata/v1/c4codata/AccountCollection('00163E08BFEC1ED785AE497656AAXXX')", "event": "create" }
```

The external system can call back to your C4C tenant

using the URL format: `https://my123456.ondemand.com/sap/byd/odata/v1/c4codata/AccountCollection('00163E08BFEC1ED785AE497656AAXXX')`

This call returns the details of the object modified.

# 7 SAP Cloud for Customer OData Developer's Guide

The SAP Cloud for Customer OData API Developer's Guide complements the SAP Cloud for Customer OData API Reference with usage details and provide examples for easy convenience to developers
